EXECUTIVE SUMMARY

NUMBER AND SIZE OF FILINGS

- Plaintiffs filed 170 new federal class action securities cases (filings) in 2014—four more than in 2013. The number of 2014 filings was 10 percent below the historical average of 189 filings observed annually between 1997 and 2013. (pages 4–5)

- The total Maximum Dollar Loss (MDL) of filings in 2014 was $215 billion, or 66 percent below the historical annual average of $630 billion. MDL was at its lowest level since 1997. (page 7)

- The total Disclosure Dollar Loss (DDL) decreased substantially in 2014, falling to its lowest level since 2006. Total DDL was $57 billion in 2014, 54 percent below the historical average of $124 billion. (page 6)

- For the first time since 1997, there were no mega DDL filings—filings with a DDL of at least $5 billion. Only two mega MDL filings—filings with an MDL of at least $10 billion—occurred in 2014, both of which related to oil and gas companies. (page 19)

OTHER MEASURES OF LITIGATION INTENSITY

- Looking at the full universe of U.S. exchange-listed companies, 3.6 percent were subject to filings in 2014, an increase from 3.4 percent in 2013. (page 9)

- Companies in the S&P 500 were less likely to be targeted by a securities class action in 2014 than in any year measured (2000 through 2014). (page 17)

- Of the S&P 500 companies, those with the largest market capitalizations were less likely than smaller firms to be the subject of a class action filing—a departure from historical experience. (page 18)

EXECUTIVE SUMMARY continued

KEY TRENDS

- **IPO activity** continued the upward trajectory that has followed the nadir of offerings in 2008 (with potential implications for future litigation). (page 10)

- The percentage of filings against **foreign issuers** increased in 2014 for the first time in three years. (pages 15–16)

- Filings against companies in the **Consumer Non-Cyclical sector**—which includes biotechnology and pharmaceutical firms—increased markedly in 2014. (pages 22–23)

- Filings against **energy companies** gained prominence in the fourth quarter of 2014 as oil and gas prices declined. (pages 19 and 22)

- Collectively, filings in the **Second and Ninth Circuits** in 2014 were more consistent with historical averages compared with the number filed last year, although total MDL and DDL declined considerably relative to historical averages. Filings in the **Third Circuit** increased to the highest level since 2004. (page 25)

Filings have increasingly targeted firms in the biotechnology and pharmaceutical industries.
NEW FOR THE 2014 YEAR IN REVIEW

TRENDS IN THE NUMBER OF PUBLIC COMPANIES AND THEIR LITIGATION EXPOSURE

This analysis tracks the number of companies listed on U.S. exchanges, as well as the likelihood they were the subject of a class action filing. (pages 9–10)

• The number of companies listed on U.S. exchanges increased recently after a 15-year decline, due in part to the quickening pace of IPO activity in 2014.
• On major U.S. exchanges, there were 206 IPOs in 2014, a 31 percent increase from 2013.
• The likelihood that a public company was the subject of a filing remained above the historical average in each of the past five years.

DISMISSAL TRENDS

This analysis revisits earlier work conducted in 2010 and 2013 examining the outcomes of class action filings. Starting in the mid-2000s, the likelihood of dismissal began increasing. (pages 12–13)

• Filings have been dismissed at a rate of 59 percent and 58 percent in cohort years 2010 and 2011, respectively. Dismissal rates for these years may edge higher as pending cases are resolved.
• For cohort year 2012, 40 percent of filings have been dismissed. Dismissal rates for this cohort year will increase as class actions are resolved for the ongoing cases filed in that year.
• Statistical tests indicate that the likelihood of dismissal remains higher for filings in recent cohorts even after controlling for filing characteristics such as filing type, industry, and circuit.

NEW DEVELOPMENTS

• Halliburton Co. v. Erica P. John Fund (page 26)
NUMBER OF FILINGS

KEY FINDINGS

- The 170 filings in 2014 represent a slight increase (2 percent) from 2013, although the number of filings continues to remain well below the 1997–2013 average of 189 filings.

- Despite the subdued total filing activity relative to the historical average, the number of “traditional filings”—those excluding credit crisis, merger and acquisition (M&A), and Chinese reverse merger (CRM) cases—was 8 percent lower than the 1997–2013 historical average of 167.

- Filings related to CRMs have waned and were minimal in 2014. Filings related to M&A transactions have persisted at the same level for the past three years.

2014 was the second consecutive year with increased filing activity.

FIGURE 2: CLASS ACTION FILINGS (CAF) INDEX™
ANNUAL NUMBER OF CLASS ACTION FILINGS
1997–2014

Note: There were two cases in 2011 that were both an M&A filing and a Chinese reverse merger company. These filings were classified as M&A filings in order to avoid double counting.
KEY FINDINGS

- Total filing activity increased 18 percent in the second half of 2014 compared to the relatively slow pace of filings in the first half of the year.

- The sharp decline in oil and gas prices during the fourth quarter of 2014 led to an increase in filings against companies in the Energy sector and contributed to the total increase in filings during the second half of the year.

- The pattern of filing activity in 2014 was similar to 2013. In both years, filings in the second half of the year distinctly outpaced the first half.

Filing activity jumped in the second half of 2014.

Note: There were two cases in 2011 that were both an M&A filing and a Chinese reverse merger company. These filings were classified as M&A filings in order to avoid double counting.
MARKET CAPITALIZATION LOSSES

Disclosure Dollar Loss (DDL) Index™

This index measures the aggregate DDL for all filings over a period of time. DDL is the dollar value change in the defendant firm’s market capitalization between the trading day immediately preceding the end of the class period and the trading day immediately following the end of the class period. DDL should not be considered an indicator of liability or measure of potential damages. See the glossary for additional discussion on market capitalization losses and DDL.

KEY FINDINGS

- The DDL Index decreased 45 percent from 2013 to 2014. This was the steepest annual decline since 2008 to 2009, when filings related to the credit crisis dropped.

- The decrease in 2014 is largely explained by the lack of any mega DDL filings. Filings with large DDLs typically account for a majority of the DDL Index. (page 21)

- The DDL Index was 46 percent of the 1997–2013 average.

The DDL Index fell to its lowest mark since 2006.

FIGURE 4: DISCLOSURE DOLLAR LOSS (DDL) INDEX™
1997–2014
(Dollars in Billions)

Note:
1. See Appendix 1 for the mean and median values of DDL.
2. Numbers may not add due to rounding.
MARKET CAPITALIZATION LOSSES continued

Maximum Dollar Loss (MDL) Index™

This index measures the aggregate MDL for all filings over a period of time. MDL is the dollar value change in the defendant firm’s market capitalization from the trading day with the highest market capitalization during the class period to the trading day immediately following the end of the class period. MDL should not be considered an indicator of liability or measure of potential damages. See the glossary for additional discussion on market capitalization losses and MDL.

KEY FINDINGS

- The MDL Index decreased 23 percent from 2013 to 2014. This decline is likely due in part to generally increasing market capitalizations resulting from the positive returns in equities markets in 2014.

- While filings in the oil and gas industry represented only 7 percent of total filings with MDL reported, they made up 23 percent of total MDL in 2014. This dramatic increase from 2013, when oil and gas filings comprised just 4 percent of the total MDL Index, stems from two mega filings in the oil and gas industry.

FIGURE 5: MAXIMUM DOLLAR LOSS (MDL) INDEX™
1997–2014
(Dollars in Billions)

Note:
1. See Appendix 1 for the mean and median values of DDL.
2. Numbers may not add due to rounding.
CLASSIFICATION OF COMPLAINTS

KEY FINDINGS

- For the third year in a row, the percentage of filings with Rule 10b-5 claims remained essentially unchanged in 2014 at 85 percent.

- The percentage of filings with Section 12(2) claims continued a five-year decline. However, filings with Section 11 claims increased from 9 percent in 2013 to 14 percent in 2014.

- For the first time since 2010, allegations regarding false forward-looking statements were made in less than half of filings.

The percentage of filings with allegations of GAAP violations increased 50 percent in 2014.

Note:
1. The percentages do not add to 100 percent because complaints may include multiple allegations.
2. First identified complaint includes allegations of GAAP Violations. In some cases, plaintiff(s) may not have expressly referenced GAAP; however, the allegations, if true, would represent GAAP Violations.
3. First identified complaint includes allegations of GAAP Violations and refers to an announcement during or subsequent to the class period that the company will restate, may restate, or has financial statements that should not be relied upon.
4. First identified complaint includes allegations of Internal Control Weaknesses over Financial Reporting.
5. First identified complaint includes allegations of Internal Control Weaknesses and refers to an announcement during or subsequent to the class period that the company has Internal Control Weaknesses over Financial Reporting.
6. Additional allegations added in complaints subsequent to the first identified complaint are not captured in this analysis.
NEW ANALYSIS: LITIGATION LIKELIHOOD OF U.S. EXCHANGE-LISTED COMPANIES

The percentage in the figure below is calculated as the unique number of companies listed on the NYSE or NASDAQ that were the subject of filings in a given year divided by the unique number of companies listed on the NYSE or NASDAQ.

KEY FINDINGS

• In 2014, approximately one in 28 companies listed on U.S. exchanges was the subject of a class action.

• The percentage of public companies subject to litigation has remained relatively constant in recent years. The declining long-term trend in the total number of filings from the late 1990s through today is a result of a decline in the number of public companies rather than a decreased likelihood of being the subject of a class action.

• The number of companies listed on U.S. exchanges increased recently after a 15-year decline. This is due in part to the quickening pace of IPO activity in 2014.

The likelihood that a public company was the subject of a filing remained above the historical average in each of the past five years.

LEGEND

<5% 5%–10% 10%–20% >20%
NEW ANALYSIS: IPO ACTIVITY

KEY FINDINGS

- IPO activity in 2014 increased 31 percent over IPO activity in 2013.

- While IPO activity in 2014 was at its highest level since 2000, with 206 public offerings, it was still dramatically lower than the average of 458 IPOs per year during the era of dot-com offerings in 1996–2000.

- Following a lull in IPOs during the financial crisis, the magnitude of IPO activity in recent years has been more comparable to the average of the early and mid-2000s, although activity markedly increased in both 2013 and 2014.

FIGURE 8: NUMBER OF IPOs ON MAJOR U.S. EXCHANGES 2009–2014

Note: These data exclude the following IPOs: those with an offer price of less than $5, ADRs, unit offers, closed-end funds, real estate investment trusts (REITs), partnerships, small best efforts offers, banks and S&Ls, and stocks not listed in the CRSP database.
NEW ANALYSIS: NUMBER OF FILINGS WITH MDL/DDL VALUES

The frequency of filings for which an MDL/DDL value can be calculated changes from year to year depending on trends in class action claims. For example, MDL/DDL cannot be calculated for certain M&A filings and filings where the securities at issue are not publicly traded.

KEY FINDINGS

- The percentage of filings for which an MDL/DDL value could be calculated decreased dramatically between 2007 and 2010. This was driven in large part by an increase in filings during the credit crisis that related to non-equity securities (e.g., mortgage-backed securities and other structured products). In recent years, fewer non-equity securities were the subject of litigation so this ratio returned to rates consistent with pre-credit crisis figures.

- In 2014, an MDL/DDL value could be calculated for 87 percent of total filings compared to the historical average of 82 percent from 1996 to 2013. The lowest value was 60 percent, recorded in 2010.

- Among all filings without an MDL/DDL in 2014, 55 percent were M&A class actions.

FIGURE 9: FILINGS WITH MDL/DDL VALUES

1996–2014
NEW ANALYSIS: STATUS OF SECURITIES CLASS ACTION FILINGS

Continuing recent analyses of class action resolutions, this report again examines whether case outcomes have changed over time. This is an extension of analyses initially conducted in 2010 and 2013 that showed dismissals were increasingly common for filings in cohort years after 2003. As each cohort ages, a larger percentage of filings are resolved—with a settlement, dismissal, or trial verdict outcome.

KEY FINDINGS

- Filings from 2012 appear to be following a similar heightened dismissal rate to those observed for filing years 2010 and 2011.

- For filings from 1996 to 2013, 49 percent have settled, 41 percent have been dismissed, and 9 percent are ongoing. Overall, less than 1 percent of filings from 1996 to 2013 reached a trial verdict. The oldest ongoing case, *Halliburton Co. v. Erica P. John Fund*, was filed in 2002 and class certification issues were ruled on by the U.S. Supreme Court in June 2014. The Court remanded the case to the district court for further proceedings.

**FIGURE 10: STATUS OF FILINGS BY YEAR 1996–2014**

Note: Percentages may not add to 100 percent due to rounding.

Dismissal rates increased for 2010 and 2011 filing cohorts compared with prior years.
STATUS OF SECURITIES CLASS ACTION FILINGS continued

The increase in dismissal rates in recent cohort years may be a function of many factors. The composition of filings may be one explanation; changing legal precedents or philosophies may be another. The findings of this report also indicate that the underlying characteristics of the complaints may also be correlated with filing outcomes.

KEY FINDINGS

- In the aggregate for cohort years 2008 through 2012, CRM, M&A, and credit crisis filings have had higher dismissal rates and slightly lower settlement rates compared with all filings. The aggregate dismissal rate for filings in these years was 52 percent, while the subset of CRM, M&A, and credit crisis cases was 56 percent.

- Statistical tests indicate that M&A filings were more likely to be dismissed and CRM filings were more likely to settle, controlling for other factors.

- The resolution of CRM, M&A, and credit crisis filings has contributed to the increase in dismissal rates, but it is not the only explanation. Other filing characteristics such as how quickly the case was filed, the length of the class period, or the size of the potential claims also appear to be correlated with whether a case settles or is dismissed. Why these characteristics matter is unclear, but they may be indicators of the merits or serve as proxies for other factors that influence filing outcomes.

Recent increases in dismissal rates are not solely explained by the influx of CRM, M&A, and credit crisis–related filings.

FIGURE 11: SETTLEMENT AND DISMISSAL RATES IN RECENT YEARS
AGGREGATE RATES FOR FILINGS IN COHORT YEARS 2008–2012
FILING LAG

KEY FINDINGS

• In 2014, the median filing lag between the end of the alleged class period and the filing date of the lawsuit matched the shortest on record, which previously occurred in 2000.

• The median filing lag in 2014 excluding M&A cases was 15 days, two days longer than the median of all cases. M&A cases are normally filed shortly after the class end date.

• Nine percent of class actions were filed more than six months (i.e., 180 days) after the end of the alleged class period—the lowest percentage on record.

• Past reports have examined the implications of “fast filers” (class actions with a filing lag of less than or equal to 60 days) and “slow filers” (those with a filing lag greater than 60 days). Fast filers are more likely to settle earlier in the litigation process and overall were less likely to be dismissed (see Cornerstone Research, Securities Class Action Filings—2012 Year in Review, pages 8–9), a finding confirmed by the statistical analyses described on the previous page.

The median filing lag in 2014 of 13 days matched the shortest on record.

FOREIGN FILINGS

Class Action Filings-Foreign (CAF-F) Index™

This index tracks the number of filings against foreign issuers (companies headquartered outside the United States) relative to total filings.

KEY FINDINGS

- The number of filings against foreign issuers increased to 34 in 2014, well above the historical average from 1997 to 2013 of 22 filings.
- The pace of foreign filings picked up in the second half of 2014, with the number of such filings more than doubling relative to the first half of the year.
- The percentage of filings against foreign issuers was 18 percent in 2013 and 20 percent in 2014 compared to the 1997–2013 historical average of 11 percent.

Continuing a long-term trend, the percentage of filings against foreign issuers increased.

FIGURE 13: CLASS ACTION FILINGS-FOREIGN (CAF-F) INDEX™ ANNUAL NUMBER OF CLASS ACTION FILINGS BY LOCATION OF HEADQUARTERS 1997–2014

[Graph showing annual number of class action filings by location of headquarters with foreign issuers as a percentage of total filings.]
FOREIGN FILINGS continued

KEY FINDINGS

- In 2014, filings against European companies increased, reversing a recent decline. Class actions included suits against companies headquartered in France, Germany, Italy, Luxembourg, and the Netherlands, none of which have been the subject of foreign filings since 2011.

- Filings against Canadian firms were the lowest in five years, returning to a level closer to the historical average.

- Other foreign filings included class actions against companies headquartered in Australia, Brazil, Israel, and the Caribbean—specifically, Bermuda, the British Virgin Islands, and the Cayman Islands.

There was a substantial increase in filings against firms headquartered in Europe.

FIGURE 14: FOREIGN FILINGS BY LOCATION OF HEADQUARTERS 1997–2014

Note: The Chinese Reverse Merger and Other China and Asia categories include filings for companies headquartered in Hong Kong.
HEAT MAPS: S&P 500 SECURITIES LITIGATION™

The Heat Maps analyze securities class action activity by industry sector. The analysis focuses on companies in the S&P 500 index, which comprises 500 large, publicly traded companies in all major sectors. Starting with the composition of the S&P 500 at the beginning of each year, the Heat Maps examine two questions for each sector:

1. What percentage of these companies were subject to new securities class actions in federal court during the year?
2. What percentage of the total market capitalization of these companies was accounted for by companies named in new securities class actions?

KEY FINDINGS

- Only one in about 45 companies (2.2 percent) in the S&P 500 at the beginning of 2014 was a defendant in a class action filed during the year, compared with one in about 29 companies (3.4 percent) in 2013. The historical average is approximately one in 17 companies (5.7 percent).

- Only the Consumer Staples and Industrials sectors exhibited above-average activity in 2014 compared with historical averages.

---

Note:
1. The chart is based on the composition of the S&P 500 as of the last trading day of the previous year.
2. Sectors are based on the Global Industry Classification Standard (GICS). The Energy and Materials sectors and the Telecommunications and Information Technology sectors appear separately but are combined for the purposes of this analysis.
3. Percentage of Companies Subject to New Filings equals the number of companies subject to new securities class action filings in federal courts in each sector divided by the total number of companies in that sector.
Larger S&P 500 firms were less likely to be targets of class actions, a reversal from previous years.
MEGA FILINGS

Mega DDL and MDL Filings

This section provides an analysis of large filings, as measured by DDL and MDL, in which mega DDL filings have a disclosure dollar loss (DDL) of at least $5 billion and mega MDL filings have a maximum dollar loss (MDL) of at least $10 billion.

KEY FINDINGS

• For the first time on record, there were zero mega DDL filings.

• There were two mega MDL filings in 2014 with a total MDL of $31 billion. This is the lowest level of mega MDL activity on record.

• The two mega MDL filings—against companies in the oil and gas industry—were filed in the fourth quarter of 2014 and originated in the Second Circuit. Both occurred at a time of falling worldwide crude oil prices.

2. Mega MDL filings have a dollar loss of at least $10 billion.
NEW ANALYSIS: DISTRIBUTION OF MDL VALUES

These charts compare the distribution of MDL attributable to filings of a given size in 2014 with the historical distribution of MDL.

KEY FINDINGS

- In 2014, mega MDL filings represented just over 1 percent of the total number of filings and 15 percent of total MDL, well below the historical averages between 1996 and 2013 of 8 percent and 72 percent, respectively.

- In the absence of a meaningful number of mega filings, cases with smaller MDLs accounted for a much larger proportion of total MDL. For example, filings with MDL of less than or equal to $1 billion (the smallest grouping displayed) were 17 percent of MDL in 2014 compared with 6 percent on average.

- Unlike previous years, the percentage of total MDL in 2014 is fairly evenly distributed across all groupings.

FIGURE 18: DISTRIBUTION OF MDL—PERCENTAGE OF TOTAL MDL ATTRIBUTABLE TO FILINGS IN THE GROUPING

Note:
1. Values are calculated only for filings with positive MDL data.
2. Size of each slice represents the percentage of total MDL.
3. Percentages may not add to 100 percent due to rounding.
NEW ANALYSIS: DISTRIBUTION OF DDL VALUES

These charts compare the distribution of DDL attributable to filings of a given size in 2014 with the historical distribution of DDL.

KEY FINDINGS

- Historically, mega DDL filings have accounted for 4 percent of total filings and 55 percent of total DDL.

- Given the lack of mega filings, class actions with smaller DDLs (less than or equal to $1 billion) accounted for 50 percent of total DDL in 2014 compared to 18 percent historically.

Note:
1. Values are calculated only for filings with positive DDL data.
2. Size of each slice represents the percentage of total DDL.
3. Percentages may not add to 100 percent due to rounding.

There were no mega DDL filings in 2014.
INDUSTRY

This analysis encompasses all filings, both the large capitalization companies of the S&P 500, shown on the preceding pages, as well as smaller companies.

KEY FINDINGS

- Filings against companies in the Financial sector increased for the third consecutive year, but the number of filings against companies in this sector still remained below the historical average. Likewise, the DDL for filings against Financial sector companies, $7 billion, remained well below the historical average of $20 billion (see Appendix 2).

- As oil and gas prices slumped in the fourth quarter of 2014, six class actions were filed against oil and gas companies. These filings represented 40 percent of the total Energy sector filings in 2014.

- Filings against companies in the Communications sector fell to the lowest level since 2010, comprising 10 percent of total filings in 2014.

FIGURE 20: FILINGS BY INDUSTRY

Class actions against companies in the Consumer Non-Cyclical sector were again the most common filing.

Note:
1. Filings with missing sector information or infrequently used sectors may be excluded. For more information, see Appendix 2.
2. Sectors are based on the Bloomberg Industry Classification System.
KEY FINDINGS

- Filings in the Consumer Non-Cyclical sector increased by 40 percent, from 45 filings in 2013 to 63 in 2014. This increase was largely fueled by an 111 percent increase in filings against biotechnology firms.

- Filings against biotechnology firms represented 30 percent of total Consumer, Non-Cyclical class actions filed in 2014, triple the historical average as a percentage of filings.

- Filings against pharmaceutical firms increased for the second year in a row.

- Within the Other category, filings against companies in the Commercial Services subsector were at the highest level since 1999.

Class actions against biotech and pharma companies were predominant in the Consumer, Non-Cyclical sector.

FIGURE 21: FILINGS IN THE CONSUMER, NON-CYCICAL SECTOR

Note:
1. Sectors and subsectors are based on the Bloomberg Industry Classification System.
2. The Other category is a grouping primarily encompassing the Agriculture, Beverage, Commercial Services, and Food subsectors.
EXCHANGE

KEY FINDINGS

- In 2014, 82 class actions were filed against NASDAQ-listed companies compared to 75 filings against companies listed on the NYSE.

- The number of filings against NYSE firms represents a 36 percent increase over the number of filings in 2013. Meanwhile, the number of filings against NASDAQ firms decreased by 15 percent.

- The median DDL for filings against NASDAQ companies increased 7 percent in 2014 compared with 2013, whereas the other measures of the typical size of a filing against NYSE and NASDAQ companies decreased. The decline in these other measures is consistent with the lack of mega filings.

- The number of filings against issuers not listed on an exchange was 13, the same as in 2013.

The percentage of filings against firms listed on the NYSE and NASDAQ was close to the historical average.

2. NYSE Amex was renamed NYSE MKT in May 2012.
CIRCUIT

KEY FINDINGS

- Filing activity in 2014 in the Second and Ninth Circuits collectively was close to the historical average of 50 percent of filings.

- Filings in the Third Circuit increased to the highest level since 2004, attributable in part to an increase in filings against companies in the biotechnology and pharmaceutical industries.

- DDL and MDL in all circuits were at or below historical averages. Even though both mega DDL filings in 2014 originated in the Second Circuit, the Second Circuit’s DDL declined to $24 billion, close to half of the historical average of $42 billion (see Appendix 3).

FIGURE 23: FILINGS BY COURT CIRCUIT

Note: For more information, see Appendix 3.
NEW DEVELOPMENTS

HALLIBURTON CO. V. ERICA P. JOHN FUND

In a highly anticipated ruling, on June 23, 2014, the U.S. Supreme Court issued its opinion in Halliburton Co. v. Erica P. John Fund (Halliburton II). At issue in this appeal by Halliburton was the fraud-on-the-market presumption established in Basic Inc. v. Levinson (1988).

For a typical Rule 10b-5 securities class action with allegations of misrepresentations, Basic established that plaintiffs did not need to demonstrate that individual class members relied on any allegedly misleading statements if the market in which the security at issue traded can be shown to be “efficient”—that is, the market price reflected all publicly available information. In those circumstances, any material misrepresentations were deemed to be reflected in the price of the security.

Petitioners asked the Court to overrule or substantially modify Basic. They further asked whether defendants may rebut the presumption of reliance, when invoked by plaintiffs, by introducing evidence that the alleged misrepresentations did not distort the market price of the security at issue.

In Halliburton II, the Court declined to overturn Basic. It did find, however, that defendants could rebut the presumption prior to class certification by showing direct evidence “that the alleged misrepresentations did not actually affect the stock price—that is, that it had no ‘price impact.’” It is too early to tell the long-term impact of the Supreme Court’s ruling. Clarification regarding the standard of proof of no price impact that courts may require of defendants is but one area of future uncertainty.
GLOSSARY

**Chinese reverse merger (CRM) filing** is a securities class action against a China-headquartered company listed on a U.S. exchange as a result of a reverse merger with a public shell company. See Cornerstone Research, *Investigations and Litigation Related to Chinese Reverse Merger Companies*.

**Class Action Filings (CAF) Index™** tracks the number of federal securities class action filings.

**Class Action Filings-Foreign (CAF-F) Index™** tracks the number of filings against foreign issuers (companies headquartered outside the United States) relative to total filings.

**Disclosure Dollar Loss (DDL) Index™** measures the aggregate DDL for all filings over a period of time. DDL is the dollar value change in the defendant firm’s market capitalization between the trading day immediately preceding the end of the class period and the trading day immediately following the end of the class period. DDL should not be considered an indicator of liability or measure of potential damages. Instead, it estimates the impact of all information revealed during or at the end of the class period, including information unrelated to the litigation.

**Filing lag** is the time between the end of a class period and the filing of a securities class action.

**Heat Maps of S&P 500 Securities Litigation™** analyze securities class action activity by industry sector. The analysis focuses on companies in the Standard & Poor’s 500 (S&P 500) index, which comprises 500 large, publicly traded companies in all major sectors. Starting with the composition of the S&P 500 at the beginning of each year, the Heat Maps examine two questions for each sector: (1) What percentage of these companies were subject to new securities class actions in federal court during the year? (2) What percentage of the total market capitalization of these companies was accounted for by companies named in new securities class actions?

**Market capitalization losses** measure changes to market values of the companies subject to class action filings. Market capitalization losses are tracked for defendant firms during and at the end of class periods. They are calculated for publicly traded common equity securities, closed-ended mutual funds, and exchange-traded funds where data are available. Declines in market capitalization may be driven by market, industry, and/or firm-specific factors. To the extent that the observed losses reflect factors unrelated to the allegations in class action complaints, indices based on class period losses would not be representative of potential defendant exposure in class actions. This is especially relevant in the post-*Dura* securities litigation environment. In April 2005, the U.S. Supreme Court ruled that plaintiffs in a securities class action are required to plead a causal connection between alleged wrongdoing and subsequent shareholder losses. This report tracks market capitalization losses at the end of each class period using DDL, and market capitalization losses during each class period using MDL.

**Maximum Dollar Loss (MDL) Index™** measures the aggregate MDL for all filings over a period of time. MDL is the dollar value change in the defendant firm’s market capitalization from the trading day with the highest market capitalization during the class period to the trading day immediately following the end of the class period. MDL should not be considered an indicator of liability or measure of potential damages. Instead, it estimates the impact of all information revealed during or at the end of the class period, including information unrelated to the litigation.
GLOSSARY continued

Mega filings include mega DDL filings, securities class action filings with a DDL of at least $5 billion; and mega MDL filings, securities class action filings with an MDL of at least $10 billion.

Merger and acquisition (M&A) filing is a securities class action that has Section 14 claims, but no Rule 10b-5, Section 11, or Section 12(2) claims, and involves a merger and acquisition transaction.

Securities Class Action Clearinghouse is an authoritative source of data and analysis on the financial and economic characteristics of federal securities fraud class action litigation, cosponsored by Cornerstone Research and Stanford Law School.

RESEARCH SAMPLE

• The Stanford Law School Securities Class Action Clearinghouse, in collaboration with Cornerstone Research, has identified 3,898 federal securities class action filings between January 1, 1996, and December 31, 2014 (securities.stanford.edu).

• The sample used in this report is referred to as the “classic filings” sample and excludes IPO allocation, analyst, and mutual fund filings (313, 68, and 25 filings, respectively).

• Multiple filings related to the same allegations against the same defendant(s) are consolidated in the database through a unique record indexed to the first identified complaint.
The authors request that you reference Cornerstone Research and the Stanford Law School Securities Class Action Clearinghouse in any reprint of the information or figures included in this study.
